

FIVE PAGES · SEPTEMBER 2026

Every step has a name on it.

Five pages you can read on your phone. Where a business that buys in Dubai and sells in Africa actually loses money, and how one system puts a name on every transaction from the container to the shop shelf.

Prepared for Mr Shilpen · Spectrum DMCC

Murat Selim Ozturk · CEO, Trackon Software FZCO · Dubai

A logistics floor, a spreadsheet, and nobody's name

The logistics department of a grain trading house ran every cargo from Excel. Millions of tonnes a year. Vessels, documents, trucks, banks.

THE WORK

Tasks had no order. Two people did the same job. Nobody did the next one.

THE MOMENT

When a cargo went wrong, every explanation ended the same way: **"It was not me."** Nobody accepted an error, so nobody could prevent the next one.

WHAT WE DID

We did not start by writing software. We sat on that floor and watched how a cargo really moved. The flow was already there. Nobody had written it down. We wrote it down as steps and gave every step a name.

Thirty years and five million tonnes a year later, every screen in Trackon still runs on that flow.

A step is a task with one owner, one deadline, one record

STEP 05 · LOGISTICS

DONE

Shipping documents to bank

OWNER

Documents specialist

DUE

B/L date + 5 days

COMPLETED

by name, date, time

ATTACHED

B/L · invoice · COA · courier cost

- **Configured per department.** Logistics, execution and finance each define their own steps: in sequence or in parallel, mandatory or optional. Your flow, not ours.
- **People organised by profession.** Document steps go to the documents specialist, vessel steps to chartering, payment steps to treasury. Not to whoever is free.
- **The record is the accountability.** Who did what, when, with which document and at what cost sits on the step. A cost entered on a step lands on that cargo's profit the same day, not at month end.

Contracts, shipments, documents, invoices, cash and P&L sit on this one spine. Nothing is typed twice.

Every shop transaction with a name on it

Head office buys and ships. The depot receives. The shops accept stock, sell and spend. Each of those is a step, and each step has a name on it.

RECEIVE STOCK

The shop manager accepts the transfer with one tap on their own phone. The name, the time and the quantity are on the record. A shortage is visible the same day, not at stock count.

SELL

Product, quantity, price, receipt. Every sale carries the staff member who made it and the landed cost of the item, so profit per shop and per product is real, not estimated.

RECORD EXPENSES

Rent, transport, utilities, wages: recorded by the shop, approved by head office, landing on that shop's profitability. The same books head office runs on. No spreadsheets sent at month end.

Any Android or iPhone. Installs from a link. Each user sees only their own shop; head office sees all of them.

Contributions

- 1 A trading house rarely loses money on the trade. It loses it between desks, on steps nobody owns.
- 2 The flow already exists in your company. Writing it down as steps, one name on each, is the system.
- 3 One system from the purchase contract in Dubai to the receipt in the shop: landed cost per item, stock per shop, profit per shop, with the person behind every entry.

Every step has a name on it.

NEXT STEP

Your shop managers try the demo shop on their own phones this week: one stock receipt, one sale, one expense. Then we confirm the scope and the start date together.
