

LIVE DEMO · AUGUST 2026

One cargo, from contract to profit. Everything in one place.

How a ten-person trading house runs contracts, shipments, documents, invoices, cash and P&L without a large back office, from the first cargo onwards.

Prepared for Mr Ayhan Yalcintas · Mr Fatih Ziya Akdogan and team

Murat Selim Ozturk · CEO, Trackon Software FZCO · Dubai

WHO WE ARE

Built by traders, for trading

30 years of trading know-how

Trackon was not designed by software people guessing how trading works. It was written inside a trading house, by the people who ran the trades, and refined with every cargo since.

Proven at USD 2 billion a year

Developed within Hakan as the main tool to manage about USD 2 billion of trade and 5 million tonnes of sales a year, from Africa to Russia and from Canada to India.

Running today, around the clock

Live at trading and processing companies in the United States, the Gulf and Turkey. Cloud hosted, web based, with a measured uptime of 99.99% across all customers.

Multi-branch · multi-currency · multi-language · integrated accounting, finance, warehouse and general ledger

THE NEXT 60 MINUTES

One trade, start to finish. Then the owner's view.

1

One cargo, live in the system

Purchase contract, sale contract, shipment, documents, costs, invoices, payment. We follow a single trade through every desk. About 30 minutes.

2

The owner's view

Open positions, mark to market, profit per trade, cash, limits, who sees what. What the founders look at every morning. About 15 minutes.

3

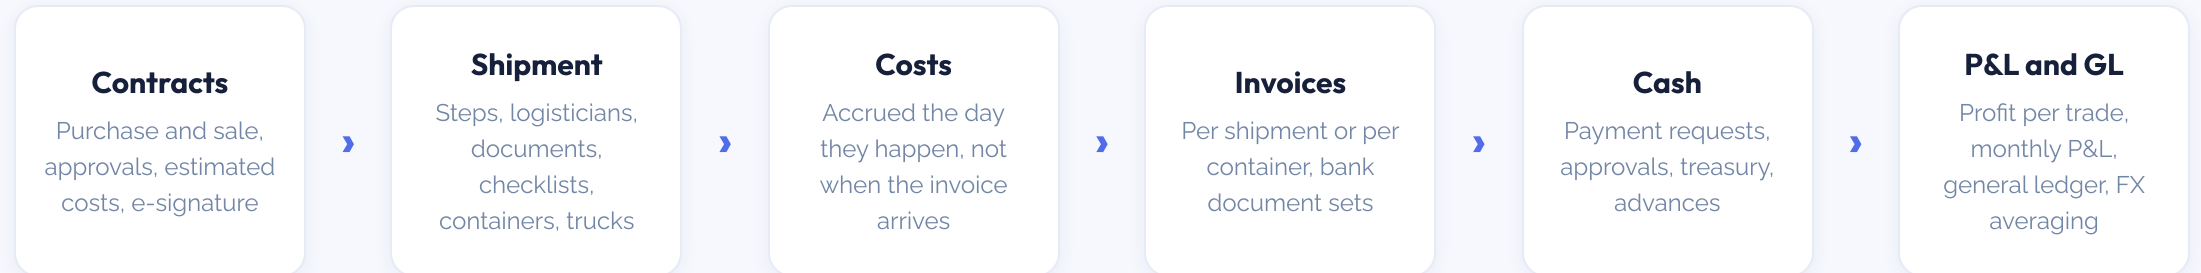

Your questions

Anything you want opened on screen. Tell us your commodities, routes and payment terms and we will use your example, not ours. About 15 minutes.

HOW IT WORKS

The contract is the source. Everything downstream inherits from it.

ONE TRADE THREAD

Nothing is typed twice. The trader enters the contract once; logistics, finance and accounting work on the same record, each from their own screen. The estimate the trader made on day one is compared against the real result on the last day, automatically.

WHO SEES WHAT

Four desks, one record, four different screens

Trader

Contracts, estimated costs, own counterparties only. Profit of each own trade. Open positions, mark to market, monthly and shipment P&L. Email alerts on receipts, payments, vessels arriving.

Logistics

Shipment steps in sequence or parallel, mandatory or optional. Expenses, documents and checklists per step. In-transit warehouse for cargo on water. Warehouse acceptance on iPad.

Finance

Mostly control and approval. Payment requests, advances, bank document submissions. Origination FX averaging per vendor. Accruals posted to GL monthly.

Owner

Everything. Dashboards, limits per customer and vendor (open account, CAD, LC), blacklists, approval flows per department, prices hidden where needed, full audit trail.

Two traders on the same desk do not see each other's customers or vendors unless you decide they should.

WHAT YOU SAW

Six things that protect a trading house

- **No double entry.** One contract feeds shipment, invoice, payment and ledger. Fewer people do more, with fewer mistakes.
- **Profit known at any moment.** Every cost is attached to its trade the day it happens, so the trade's result is never a surprise at month end.
- **Costs accrued before invoices arrive.** Late freight and truck invoices do not distort your monthly P&L.
- **Documents and bank sets built in.** Checklists, generated documents, submissions to the bank, all on the shipment record.
- **Risk controls before the mistake.** Limits per counterparty and payment term, blacklists, approval flows, hidden prices.
- **Nothing depends on one person.** Every action is recorded and visible. A trader leaving, a laptop lost, an unfortunate event: the business keeps running.

WHY DAY ONE

A new company has an advantage: nothing to unlearn

Process designed in from the first cargo

No spreadsheets to migrate, no habits to break. Approval flows, cost estimates and document checklists are how the team works from the first day.

Startup package

Company and product setup, business process setup, standard report pack with your header, training for your users. You start clean, so you start fast.

Grows with you

Add branches, currencies, languages and users as volume grows. Dashboards, AI assistant access to your own reports, and TrackonAI logistics modules when you need them.

Cloud hosted

Web based

iPad warehouse app

1C and Logo ERP integration

Multi-branch

Multi-currency

Multi-language

NEXT STEPS

From this demo to your first cargo in the system

- 1 You send us your product list, your typical trade flows and the list of users with their roles.
- 2 We configure this environment with your products and counterparties, and your team works one of your own trades through it hands-on.
- 3 Go-live plan agreed with Mr Yalcintas and Mr Akdogan: setup, training, first live trade.
