

IMPLEMENTATION PROPOSAL · JULY 2026

Claims Console for Mana

A new Claims Console in Trackon, working like the Logistics Console your team already knows. An Add button opens a guided wizard for claim details and supporting documents, and approved claims become claim records automatically.

Prepared for Josh Hosking · Mana

Murat Selim Ozturk · CEO, Trackon Software FZCO

THE OBJECTIVE

What we are solving

Today, raising a claim depends on emails, spreadsheets and manual entry. Details arrive incomplete, supporting evidence is scattered, and someone still has to key the final claim into the system by hand.

The **Claims Console** replaces that: a new console in Trackon, sitting alongside the consoles your team already uses, such as the Logistics Console. It lists every claim with its status, and an **Add** button opens a guided wizard that walks the user through the claim step by step. Required details and supporting documents are collected up front; nothing can be submitted incomplete.

Every claim then passes through a formal **approve / reject** step. Only approved claims become claim records in Trackon, created automatically with no re-keying. No separate system, no new sign-in: it all lives where your team already works.

Inside Trackon, no new system

Guided, step-by-step entry

Complete claims only

Controlled approval

HOW IT WORKS

From first entry to a claim in Trackon

THE CLAIM JOURNEY

- The wizard validates as the user goes: mandatory fields, amounts, references and attachments are checked **before** submission, not after.
- Reviewers see the full claim with its evidence in one place and approve or **reject with a reason**; the submitter is notified either way.
- Rejected claims never become claim records. Approved claims are created through Trackon's real business rules, so what lands is always valid.

THE EXPERIENCE

Built for the people filing claims

For submitters

- A wizard that asks one thing at a time, with no blank forms and no guesswork
- Upload supporting documents directly into the claim
- The console shows every claim and its status: submitted, in review, approved, rejected
- Clear rejection reasons, so a claim can be corrected and resubmitted

For reviewers

- Pending claims in one console view, complete with evidence
- Approve or reject with comments in one click
- Full audit trail of who filed, who decided, when and why
- Approved claims become claim records with zero manual entry

Claim types, required fields, evidence rules and the approval chain follow what we defined together in our working sessions.

CLEAR BOUNDARIES

What sits where

Trackon delivers

- The new Claims Console in Trackon, alongside your existing consoles
- The Add-button wizard for guided claim entry
- Approval / rejection workflow & notifications
- Document upload & storage with the claim
- Claim records created automatically on approval, with a full audit trail
- Testing, go-live and training

Mana provides

- Claim types, required fields and business rules
- The approval chain: who reviews, who decides
- Which Trackon users submit and which approve
- Sample historical claims for testing
- UAT participation before go-live

YOUR INVESTMENT

Capped hours. You won't pay more.

The design is already clear from our working sessions together, so we go straight to build. The whole engagement, including meetings, development, testing and go-live, is billed on actual time at **\$100/hour**, capped at **160 hours**.

MAXIMUM INVESTMENT

This scope, delivered

\$16,000

Hard cap · 160 hours · includes meetings, development, testing and go-live

PAY ONLY FOR TIME USED

Actual hours billed

≤ 160 h

Finish in fewer hours and you are invoiced only the time spent. Take longer for any reason within this scope and the overrun is **ours**; the cap holds.

Prices in USD, exclusive of any applicable taxes. Once live, the Claims Console is supported like the rest of your Trackon system.

Workstreams

WORKSTREAM	SCOPE
Claims Console	New console in Trackon, like the Logistics Console, listing every claim with its status
Add wizard	Guided multi-step entry dialog with live validation and document upload
Approval workflow	Review from the console, approve / reject with comments, notifications, audit trail
Claim creation	Approved claims become claim records in Trackon through its business rules
Roles & access	Submitter and reviewer roles for existing Trackon users
Test & go-live	End-to-end testing with real claim samples, UAT, deployment, training

MAXIMUM · ALL WORKSTREAMS

\$16,000

Everything above is covered by the **160-hour cap**, with meetings, development, testing and go-live included. Actual hours are reported transparently and invoiced as spent, never beyond the cap.

FOR CLARITY

Assumptions

- The scope baseline is what we defined together in our working sessions: a new **Claims Console** in Trackon with an Add-button wizard, an approve / reject workflow, and claim records created automatically on approval.
- The **160-hour / \$16,000 cap** applies to this scope, including meetings, development, testing and go-live. Time is billed at \$100/hour on actual hours spent, never beyond the cap.
- The console is used by **existing Trackon users**; Mana confirms who can submit and who approves.
- Approved claims become claim records through Trackon's business rules; everything downstream of claim creation works as it does today.
- Mana provides sample historical claims for testing and participates in UAT.
- Changes to claim types or workflow beyond this scope are quoted separately as amendments.

NEXT STEPS

Let's get started

- 1 Confirm the go-ahead: maximum **\$16,000**, capped at 160 hours, this scope delivered.
- 2 Short kickoff to lock the console layout, wizard steps and the approval chain from our working sessions.
- 3 We build, test with your team, and go live, with **actual hours invoiced and never beyond the cap**.
