

Salesforce → Trackon Contract Integration

Approved upstream Purchase / Sales contracts flow automatically from Salesforce into Trackon, with master data kept current from Trackon back to Salesforce.

Prepared for Justin Evans · DFA / Mana

Murat Selim Ozturk · CEO, Trackon Software FZCO

THE OBJECTIVE

What we are solving

Mana is adopting **Salesforce** as the front end for all upstream Purchase and Sales contracts. Once a contract is approved in Salesforce, it should arrive in **Trackon** automatically, created in approved status, with no re-keying.

From that point, Trackon remains the **system of record** for the contract and everything downstream, exactly as it works today.

In parallel, Trackon keeps Salesforce current with the master data it depends on: counterparty status, payment terms, credit limits and addresses.

No re-keying

No duplicate systems of record

Existing Trackon process untouched

CONFIRMED SCOPE

The agreed model

Contracts

SALESFORCE → TRACKON

Approved contracts flow **one way** from Salesforce into Trackon, created in approved status. After creation, all edits, **amendments** and **cancellation / termination** happen in Trackon only. Trackon is the system of record.

Master data

TRACKON → SALESFORCE

Trackon is the **master** for customers and vendors. It pushes account status (active / inactive), payment terms, credit limits and addresses to Salesforce so the front end stays current. Changes always start in Trackon.

One way in each direction. No two-way sync, no conflicting edits to reconcile. The simplest, most robust design.

HOW IT WORKS

The integration flow

CONTRACT CREATION

MASTER DATA

Exceptions screen

Any contract that fails validation (e.g. a blocked counterparty) is flagged in Trackon for a user to resolve in place, never silently rejected.

CLEAR BOUNDARIES

What sits where

Trackon delivers

- Secure API on the Trackon side
- Inbound contract creation logic
- Outbound master-data feed
- Exceptions / validation screen
- Integration backbone & monitoring
- Testing, go-live and support

DFA IT delivers

- Salesforce platform & licensing
- The approval trigger in Salesforce
- Outbound call to Trackon's endpoint
- Salesforce field & object setup
- Sandbox for build & testing
- Salesforce-side credentials

Salesforce expertise stays on DFA's side, where the resources are. Trackon builds only on the Trackon side.

THE FOUNDATION

One piece is built once, and it lasts

Trackon Legacy does not expose an API today. Before any integration can run, Trackon needs a **secure API layer** that creates a contract through Trackon's own business rules, not by writing raw data, which would risk invalid contracts downstream.

This foundation is the single largest part of the work. It is also a **reusable asset**: once built, it underpins not just Salesforce but any future integration Mana may want.

Built through Trackon's real contract logic

Reusable beyond Salesforce

On Trackon's OCI cloud

YOUR INVESTMENT

A simple two-step path

We design first, then build. You commit to a small, fixed first step; the larger build is priced firmly only after that design removes the unknowns. You never sign off a padded number.

STEP 1 · START HERE

Design & Discovery

\$7,500

Fixed price · ≈ 3 weeks · delivers a fixed Step 2 quote

STEP 2 · BUILD & GO-LIVE

Full integration build

\$36k – \$48k

Indicative · fixed after Step 1

ONCE LIVE · RECURRING

Integration Support & Maintenance

Hosting, monitoring, error handling and support, including third-party platform fees (Oracle Integration Cloud / OCI).

from ~\$1,000/mo

One-time build, indicative: ≈ \$43,500 – \$55,500. Salesforce licences (~35 users) are DFA's cost, excluded. Prices in USD, exclusive of any applicable taxes.

PHASE 1 · DESIGN & DISCOVERY

Scope & investment

DELIVERABLES

- Salesforce ↔ Trackon field-mapping specification
- Trackon API design (contract creation through business rules)
- Master-data feed design
- Contract authoring & clause / printing workflow defined
- Integration pattern & security confirmed with DFA IT
- Solution design document and a **fixed, itemised Phase 2 quote**

FIXED PRICE

\$7,500

DURATION

≈ 3 weeks

Delivers a fixed Phase 2 quote

Workstreams & estimate

WORKSTREAM	SCOPE
Trackon API foundation	Secure API layer creating contracts through Trackon's business rules
Inbound contracts	Receive, validate, map and create approved contracts; durability & retry
Outbound master data	Push status, payment terms, credit limits, addresses to Salesforce
Exceptions screen	In-Trackon resolution of any contract that fails validation
Integration backbone	Orchestration, monitoring, coordination with DFA IT on the SF connection
Test & go-live	Sandbox testing, UAT, deployment, go-live support

INDICATIVE ESTIMATE

\$36k – \$48k

Range shown for planning. **Fixed and itemised at the end of Phase 1**, once field mapping and the API approach are confirmed.

FOR CLARITY

Assumptions

- Salesforce **pushes** approved contracts to Trackon's endpoint (DFA IT builds the trigger and call).
- DFA IT provides Salesforce-side technical resources, credentials and a **sandbox** for build and testing.
- Salesforce captures the fields Trackon needs to create a valid contract; gaps identified in Phase 1 are closed on the Salesforce side.
- Clauses, document generation and the clause library remain in Trackon; Salesforce sends the deal terms.
- Salesforce consumes Trackon-originated counterparties only; it does not create vendors or customers locally.
- Everything downstream of contract creation in Trackon remains as it works today.
- Mana runs on Trackon's existing shared environment. If contract volume grows substantially, a dedicated server may be recommended; this would be scoped and **priced separately**.

NEXT STEPS

Let's get started

- 1 Approve Phase 1 (Design & Discovery): **\$7,500**, ~ 3 weeks.
- 2 Joint working session with DFA IT to confirm the Salesforce push pattern and field mapping.
- 3 Phase 1 delivers the design and a **fixed Phase 2 quote**, then we build.
